<u>Summary:</u>	<p>In the municipality of Yafo, Tel Aviv, urban renewal is being undertaken taking a social perspective. As the majority of vulnerable people (people with low socio-economic status, elderly people, migrants and refugees, etc...) are living in areas of Yafo targeted for urban renewal, the Municipality's urban renewal and city social planning are being informed by the use of geographic information system (GIS) mapping to map the social and economic situation of vulnerable groups living in the municipality and through social surveys in order to learn about the daily functioning of the population in designated areas. This has contributed to the development of an evidence-based, inclusive, integrated and sustainable city strategy. The GIS mapping was performed using municipal data, water use and consumption data and information from social services. The programme is being implemented through a collaboration between the city planning division, the strategic planning unit, community social workers, architects, urban planners and local change actors.</p>
<u>Resources:</u>	The programme was fully funded by the municipality of Yafo.
<u>Objectives:</u>	The main objective of the programme was taking a social perspective in urban renewal to inform the overall city plan and respond to the needs of the vulnerable population living in Yafo.

<u>Outcomes:</u>	The programme led to the creation of a social database with information on needs of the vulnerable population living in the municipality of Yafo. The use of GIS mapping allowed the physical planning to be more sensitive towards the needs of the most vulnerable groups. Priorities were for example shifted to the need to ensure accessibility to public services, affordable housing and an adaptation of residential apartments to a variety of households had to be undertaken.
<u>Evaluation of practice:</u>	The programme has not yet been fully evaluated.
